

# JOBS AND ECONOMIC IMPACT OF CARBON CAPTURE DEPLOYMENT Delaware

## TOTAL JOBS POTENTIAL

Project Jobs	Operations Jobs
80	40

Delaware has the opportunity to create an annual average of up to **80 project jobs** over a 15-year period and **40 ongoing operations jobs** through the deployment of carbon capture at one industrial facility. Developing carbon dioxide (CO<sub>2</sub>) capture, transport and storage infrastructure at these facilities could generate up to **\$240 million in private investment** and capture **one million metric tons** of CO<sub>2</sub> every year.

## CREATING JOBS & CAPTURING CARBON

Carbon capture is essential to meeting mid-century emissions reduction goals while retaining and growing a domestic base of high-wage energy, industrial, and manufacturing jobs. Carbon capture retrofits require facilities to be outfitted with technologies to remove the CO<sub>2</sub> and ensure it is transport ready. The type of technology used is dependent on the type of plant and varies across industry and facilities. There are jobs associated with the equipment, materials (e.g. cement and steel), engineering, and labor required to install the capture technology, as well as ongoing jobs to operate and maintain the retrofits. These are referred to as **project jobs** and **operations jobs**.

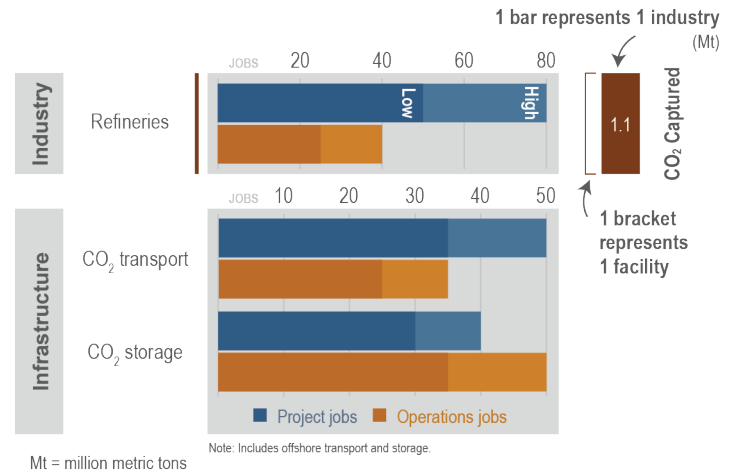

## METHODOLOGY

Rhodium Group performed an economic analysis based on the Regional Carbon Capture Deployment Initiative's Near- and Medium-Term capture potential scenario. The Rhodium analysis quantifies the economic impact and employment opportunities of carbon capture retrofit projects by deploying state-specific data in the IMPLAN economic model. The analytical results measure the impact of project investment and operation costs through expected annual jobs. Average annual project jobs were calculated assuming deployment of all projects over a 15-year period. The jobs reported are in-state jobs, directly associated with carbon capture retrofits. They do not include other jobs at the facilities, nor indirect and induced jobs.

## RESULTS

Delaware's only refinery holds some potential for emissions reductions and job creation with carbon capture retrofit, with the potential to create an annual average of up to 80 project jobs and 40 ongoing operations jobs while capturing one million metric tons of CO<sub>2</sub> per year. The development of transport infrastructure would create an annual average of up to 50 project jobs and 35 ongoing operations jobs. The development of storage infrastructure would create an annual average of up to 40 project jobs and 50 ongoing operations jobs.

## ANNUAL PROJECT AND OPERATIONS JOBS

This figure depicts the low and high range of estimated annual average project jobs, transport infrastructure jobs, and ongoing operations jobs that could be created through carbon capture retrofits at industrial and power facilities in Delaware. The potential amount of CO<sub>2</sub> captured and the number of potential near- or medium-term capture facilities in each industry are shown above.
